

Introduction to Regression Modeling – Part II

Johns Hopkins Engineering

625.461 Statistical Models and Regression

Module 1 – Lecture 1C

Two Main Types of Regression Models

Mechanistic model

Regression model (empirical model)

⇒ approximate the unknown true functional model

Linear Regression Approximation

Figure 1.3 Linear regression approximation of a complex relationship.

Piecewise Linear Approximation

Figure 1.4 Piecewise linear approximation of a complex relationship.

Extrapolation and Its Danger in Regression

Figure 1.5 The danger of extrapolation in regression.

Multiple Linear Regression Model

$$y = \beta_0 + \beta_1 x_1 + \dots + \beta_k x_k + \varepsilon$$

y : response or dependent variable

x_i : regressor ($i = 1, \dots, k$)

β_i : regression coefficient

Q: What is the meaning of β_i ?

The values of parameters (regression coefficients) β 's are usually unknown and need to be estimated.

Important Notes

- A regression model does not imply a cause-and-effect relationship between variables.
- To establish causality, the relationship between the regressors and the response must have a basis outside the sample data.
- Regression analysis can aid in confirming a cause-effect relationship, but it cannot be the sole basis of such a claim.
- Model adequacy checking is critically important.

Purposes of Regression Analysis

- Data description
- Parameter estimation
- Prediction and estimation
- Control

Computer Software for Regression Analysis

- Minitab
- SAS
- SPSS
- JMP
- R

Regression Model Building Process

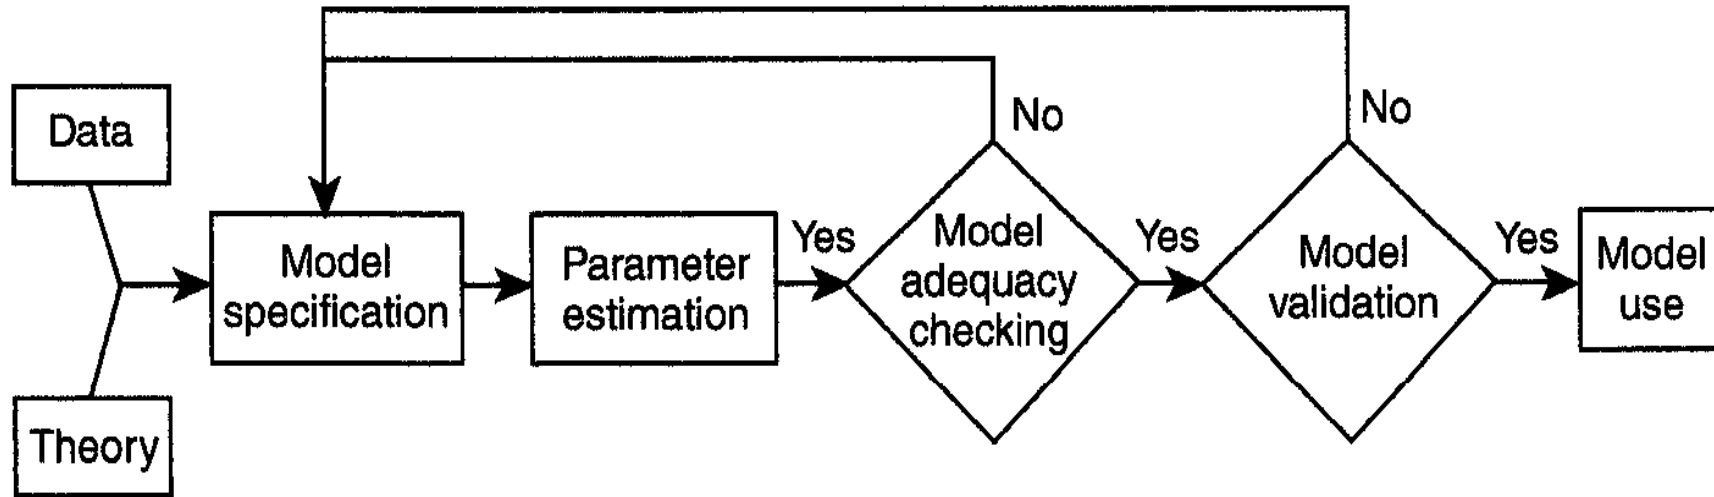

Figure 1.8 Regression model-building process.
